

THE SFM PRODUCTION AUDIT REPORT

Generated: 2026-06-25T16:14:34.583Z

Repository: thesfm-origin-main-review

Framework: Next.js 15.5.7 / React 19 / Supabase / Stripe / market-data providers

EXECUTIVE SUMMARY

THE SFM was reviewed across application routes, dashboard/admin layout usage, API routes, Supabase/RLS posture, Stripe/payment surfaces, authentication and authorization patterns, market-data provider integrations, UI shell consistency, RTL/LTR readiness, light/dark mode risks, duplicate/demo-data risks, and launch validation commands.

The codebase is a ****launch candidate with required operational checks****. Automated validation is green, production build succeeds, and several safe launch issues were fixed during this audit. Remaining launch risks are primarily operational: deploying pending Supabase migrations, confirming production environment variables, and smoke-testing real provider credentials in the target deployment.

SCORES

Area	Score	Rationale
------	-------	-----------

---	---	---
-----	-----	-----

Security	88%	Admin/API protection patterns are present, service keys remain server-side, Stripe uses server routes, and the audit removed a predictable analytics hash fallback. Remaining risk is live RLS/provider verification in the deployed Supabase project.
----------	-----	--

Code Quality	86%	TypeScript, ESLint, tests, and build pass. Shared admin shell abstraction was added. Some very large page components remain and should be decomposed over time.
--------------	-----	---

Performance	82%	Build is successful and provider caching/rate-limit patterns exist. Some feature pages, especially market analysis, remain heavy and should be split/lazy-loaded further.
-------------	-----	---

UI/UX Readiness	84%	Shared sidebar shell was restored for admin pages and recent market-page regressions have tests. Remaining readiness depends on visual smoke tests across the largest market pages and mobile layouts.
-----------------	-----	--

Launch Readiness	Conditional Go	Safe to stage after migrations/env configuration; production launch should wait for Supabase migration application, provider credential smoke tests, and Stripe webhook verification.
------------------	----------------	---

WHAT WAS REVIEWED

- 106 App Router pages.
- 108 API route handlers.
- 10 layout files.
- Supabase migration history through migration 112.
- Admin pages and protected dashboard shell usage.
- Stripe checkout, portal, and webhook route surfaces.
- Market provider routes, news/calendar adapters, trader routes, and provider status surfaces.
- Navigation/sidebar configuration and admin-only visibility.
- Localhost/private endpoint references, service-role key usage, public env exposure risks, unsafe HTML patterns, mock/demo fallback indicators, and RLS policy patterns.
- Validation commands: TypeScript, ESLint, i18n completeness, unit/integration tests, and production build.

ISSUES FOUND BY SEVERITY

High - Fixed

1. ****Admin pages missing the shared sidebar shell****
 - Affected: /sfm-admin-control, /sfm-admin-control/companies.
 - Risk: admins could lose platform navigation and admin pages looked standalone/inconsistent.
 - Fix: introduced AdminDashboardShell and wired both admin pages through the shared sidebar-aware dashboard shell.
2. ****Deprecated service-role policy check for news translation cache****
 - Affected migration/table: public.news_translations.
 - Risk: older auth.role() = 'service_role' policy style is no longer aligned with current Supabase guidance and explicit grants model.
 - Fix: added migration 111_harden_news_translations_service_role_policy.sql with a service-role-scoped policy and explicit grants/revokes.
3. ****Predictable fallback analytics hash salt****
 - Affected: src/lib/server/companyAnalytics.ts.
 - Risk: fallback salt could make IP hashes easier to compare across deployments when configured secrets are missing.
 - Fix: removed the static production fallback; analytics omits ip_hash if no server salt/secret is configured. Added ANALYTICS_HASH_SALT to .env.example.
4. ****Profile creation trigger needed explicit search-path hardening****
 - Affected: public.handle_new_user().
 - Risk: security-definer functions should pin search_path to the intended schema.
 - Fix: added migration 112_harden_profile_trigger_search_path.sql preserving behavior while setting search_path = public.

Medium - Fixed

5. ****Platform Admin navigation lacked the private trading terminal link****
 - Affected: sidebar admin group.
 - Fix: added /thesfm-trader-own with Arabic, English, and French labels and a terminal icon. Existing admin-only filtering protects visibility.
6. ****Production start script used a shell-specific port expression****
 - Affected: package.json.
 - Risk: less portable local production start behavior.
 - Fix: simplified to next start; platform deployments should provide their own runtime process.

Medium - Reviewed / Remaining

7. ****Some print/export modules use document.write****
 - Affected areas include generated reports and print windows.
 - Risk: acceptable for internal generated output when escaped, but should remain on the security backlog for sanitizer review.
 - Status: documented; not changed because it may alter export behavior.
8. ****Large page components and heavy first-load bundles****
 - Example: /market-analysis first-load JS is materially larger than most pages.
 - Status: documented for future lazy-loading/component decomposition.
9. ****Live Supabase policy verification was not performed in the remote project****
 - The Supabase CLI is not installed in this local environment and no production project credentials were used.
 - Status: migration prepared; applying and verifying in the target Supabase project remains a launch checklist item.

Low - Reviewed

10. ****Localhost references are documentation/development-only or blocked by tests****

- Runtime scans found no production self-fetch fallback to localhost. Existing trader compatibility tests enforce this.

11. ****Seed market symbols exist in migrations****

- These are static symbol universe records, not user data or demo activity records.

FIXES COMPLETED

- Added src/components/AdminDashboardShell.tsx and used it on admin dashboard/company review pages.
- Restored sidebar rendering on /sfm-admin-control and /sfm-admin-control/companies.
- Added Smart Trading Terminal admin sidebar item for /thesfm-trader-own.
- Added navigation translation key nav_smart_trading_terminal for Arabic, English, and French.
- Removed the static production fallback for company analytics IP hashing.
- Added ANALYTICS_HASH_SALT to .env.example.
- Added Supabase migration to harden the news translation cache policy and grants.
- Added Supabase migration to pin the profile creation trigger's search_path.
- Simplified npm start to a portable Next.js start command.

DUPLICATED / UNUSED CODE REMOVED

- Removed the duplicate Supabase migration created during audit consolidation and retained one migration for the news translation policy fix.
- No production components or routes were deleted. No working feature was removed.

SECURITY REVIEW

Strengths:

- Admin pages checked server-side via authenticated Supabase token and admin email allowlist.
- Trader terminal access is server-gated via getTraderAccess.
- Stripe secret usage is confined to server routes/libraries.
- Public env secret exposure scan found no NEXT_PUBLIC_*SECRET/SERVICE/PRIVATE/TOKEN/KEY misuse.
- External image resolver rejects localhost, loopback, and private network hosts before server-side fetch.
- Account activity has regression tests for empty users and user isolation.

Remaining security tasks before production:

- Apply and verify pending Supabase migrations in the production project.
- Confirm RLS policies directly in Supabase for account activity, subscriptions, company listings, analytics, trader access, and funding/admin tables.
- Configure ANALYTICS_HASH_SALT, ADMIN_EMAILS, ADMIN_ACCESS_CODE, CRON_SECRET, Supabase service key, Stripe secrets, provider keys, and webhook secrets in Preview and Production.
- Review generated print/export HTML paths for sanitization hardening.

PERFORMANCE REVIEW

Observed:

- Production build completes successfully.
- Static generation completed for 137 generated pages/routes.
- Most API routes are dynamic handlers with small route bundles.
- Heavy client pages remain: market analysis, project detail, business hub, charity projects, financial theories, setup, profile, debts.

Recommendations:

- Continue lazy-loading lower market-analysis modules.
- Split oversized page components into smaller client islands.
- Add route-level performance budgets for pages over 300 kB first-load JS.
- Add Playwright/Lighthouse smoke tests for primary desktop/mobile routes after deployment.

UI/UX REVIEW

Fixed:

- Admin pages now render inside the dashboard shell with sidebar navigation.
- Admin terminal link appears in the Platform Admin sidebar with active-state support.

Reviewed risks:

- Many market pages have been recently repaired, but should receive cross-language visual smoke tests in production data conditions.
- Largest dashboard pages still rely on substantial inline/page-local CSS; over time, migrate stable patterns into shared components.
- RTL/LTR support is present through language hooks and logical CSS, but pages with custom inline CSS should remain in regression testing.

DATA PROVIDER REVIEW

Provider surfaces reviewed:

- Yahoo Finance quote/history helpers.
- Finnhub news/ticker routes.
- FMP economic calendar provider interface.
- Myfxbook/market sentiment health routes.
- Stripe payment routes.
- Trader scanner compatibility API.

Launch checks required:

- Confirm FINNHUB_API_KEY, FMP_API_KEY, optional ECONOMIC_CALENDAR_PROVIDER, OPENAI_API_KEY/AI gateway credentials, Stripe keys, and Supabase keys are configured in deployment.
- Smoke-test provider health endpoints in Vercel Preview and Production.
- Verify provider-error UI states do not expose raw upstream errors.

VALIDATION RESULTS

Command	Result
---	---
corepack pnpm exec tsc --noEmit --pretty false	Passed
npm run lint	Passed
npm run check:i18n	Passed; all translation entries include ar/en/fr
npm run test:run	Passed; 14 files, 121 tests
npm run build	Passed; Next.js production build completed

REMAINING RISKS

- Pending Supabase migrations must be applied and verified in the target project.
- Provider credentials and Stripe webhooks must be tested in the actual deployment environment.
- Some exports still use generated HTML/print windows and should receive sanitizer-focused review.
- Bundle sizes on the largest client pages warrant future lazy-loading work.
- Visual regression tests should be expanded to cover Arabic RTL, English LTR, French LTR, dark mode, and mobile Safari for key flows.

FUTURE IMPROVEMENTS BEFORE LAUNCH

1. Add Playwright smoke tests for auth, admin, company submission, Stripe checkout creation, market analysis, charity projects, subscriptions, and market-news pages.
2. Add CI checks for production-localhost references and public secret env patterns.
3. Add Supabase policy tests with a local Supabase test harness once the CLI is available.
4. Add route-level performance budgets for large client pages.
5. Extract common market-page ticker/card/table patterns into shared components.
6. Add deployment runbook for provider credential validation and webhook replay tests.

FINAL LAUNCH CHECKLIST

- ☐ Apply all Supabase migrations, including 111_harden_news_translations_service_role_policy.sql and 112_harden_profile_trigger_search_path.sql.
- ☐ Verify RLS policies directly in Supabase for all user-owned tables.
- ☐ Configure Preview and Production environment variables.
- ☐ Verify Stripe checkout, portal, and webhook routes with test events.
- ☐ Smoke-test market data, news, economic calendar, trader terminal, and AI routes with real provider credentials.
- ☐ Smoke-test admin pages and sidebar navigation in Arabic and English.
- ☐ Confirm no raw provider errors or secrets appear in browser responses/logs.
- ☐ Run the validation suite in CI.
- ☐ Run a final mobile Safari and desktop visual pass for key dashboard and market pages.
